PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/603,792	Applicant(s) MAUFER ET AL.	
	Examiner Michael J. Moore, Jr.	Art Unit 2616	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 07 May 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) 1 and 2 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 3-20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 24 June 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Election/Restrictions

1. Applicant's election without traverse of Group II (claims **3-20**) in the reply filed on 5/7/07 is acknowledged. Accordingly, claims **1 and 2** have been withdrawn from further consideration as being directed to a non-elected invention. It is requested that Applicant cancel non-elected claims **1 and 2** in response to this Office Action.

Claim Rejections - 35 USC § 101

2. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims **15-17** are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Regarding claims **15-17**, these claims are currently directed to "functional descriptive material *per se*" (computer program) with no claimed practical application. Please see "Interim Guidelines on Patentable Subject Matter Eligibility".

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of

Art Unit: 2616

the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

5. Claims **3, 4, and 7-20** are rejected under 35 U.S.C. 103(a) as being unpatentable over Robotham et al. (U.S. 6,775,293) (hereinafter "Robotham") in view of Muller et al. (U.S. 6,483,804) (hereinafter "Muller").

Regarding claims **3 and 15**, *Robotham* teaches the storage of received data units (packets) in buffer 20 (memory) coupled to transmission block 50 (network interface circuitry) of Figure 1 as spoken of on column 3, lines 36-40.

Robotham also teaches the incrementing of count values of count table 40 (counter) as received data units (packets) are stored in the buffer 20 as spoken of on column 2, lines 45-48.

Robotham also teaches the referencing (checking) of a context table (connection table) upon reception of data units (packets) as spoken of on column 2, lines 43-45.

Robotham also teaches transmission block 50 that determines stream identifiers (packet processing) corresponding to fetched data units (packets) as spoken of on column 3, lines 45-49.

Robotham also teaches transmission block 50 that transmits (forwards) the fetched data units (packets) as transmitted data units as spoken of on column 3, lines 56-58.

Robotham also teaches the dequeuing of data from the buffer (clearing the buffer) for forwarding as spoken of on column 2, lines 49-50.

Robotham also teaches the decrementing of count values of count table 40 (counter) as data units are retrieved from the buffer and transmitted as spoken of on column 3, lines 62-64.

Robotham does not teach that responsive to non-existence of the connection table entry, sending the packets to network interface software for preparing the packets for the network interface circuitry, the network interface software for building the connection table entry.

However, *Muller* teaches a packet processing method where a flow database manager uses retrieved packet information to set up a flow in a flow database if one does not already exist for the particular flow as shown in Figure 1B and spoken of on column 11, lines 46-52.

At the time of the invention, it would have been obvious to someone of ordinary skill in the art, given these references, to combine the database flow creation teachings of *Muller* with the teachings of *Robotham* in order to allow for the processing of packets of new flows as spoken of on column 11, lines 46-52 of *Muller*.

Regarding claim 4, *Robotham* further teaches the storage of received data units (packets) in buffer 20 (local memory) as spoken of on column 3, lines 36-40.

Regarding claim **7**, *Robotham* further teaches that the count values (total count signal) in the count table 40 are adjusted to always reflect the current state (whether packets have been partially processed) of the buffer 20 as spoken of on column 3, lines 62-66.

Regarding claims **8 and 16**, *Robotham* further teaches transmission block 50 that utilizes the stream identifier (do not use flag) to retrieve the set of independent group identifiers corresponding to the particular stream from the context table 30 as spoken of on column 3, lines 50-53.

Regarding claims **9 and 17**, *Robotham* further teaches transmission block 50 (having network interface software) that determines stream identifiers (packet processing) corresponding to fetched data units (packets) as spoken of on column 3, lines 45-49.

Regarding claim **10**, *Robotham* further teaches transmission block 50 (network interface circuitry) that determines stream identifiers (packet processing) corresponding to fetched data units (packets) as spoken of on column 3, lines 45-49.

Regarding claim **11**, *Robotham* teaches the buffering circuit 100 (apparatus) as shown in Figure 1.

Robotham also teaches the storage of received data units (packets) by reception block 10 (means) in buffer 20 (memory) coupled (accessible) to transmission block 50 (network interface circuitry) of Figure 1 as spoken of on column 3, lines 36-40.

Robotham also teaches the incrementing of count values of count table 40 (counter) by reception block 10 (means) as received data units (packets) are stored in the buffer 20 as spoken of on column 2, lines 45-48.

Robotham also teaches the referencing (checking) of a context table (connection table) by reception block 10 (means) upon reception of data units (packets) as spoken of on column 2, lines 43-45.

Robotham also teaches transmission block 50 that determines stream identifiers (packet processing) corresponding to fetched data units (packets) as spoken of on column 3, lines 45-49.

Robotham also teaches transmission block 50 (means) that transmits (forwards) the fetched data units (packets) as transmitted data units as spoken of on column 3, lines 56-58.

Robotham also teaches the dequeuing of data (clearing the buffer) from the buffer by transmission block 50 (means) for forwarding as spoken of on column 2, lines 49-50.

Robotham also teaches the decrementing of count values of count table 40 (counter) by transmission block 50 (means) as data units are retrieved from the buffer and transmitted as spoken of on column 3, lines 62-64.

Robotham does not teach means for sending the packets to network interface software for preparation for the network interface circuitry responsive to non-existence of the connection table entry, including means for building the connection table entry.

However, *Muller* teaches a packet processing method where a flow database manager (means) uses retrieved packet information to set up a flow in a flow database if one does not already exist for the particular flow as shown in Figure 1B and spoken of on column 11, lines 46-52.

At the time of the invention, it would have been obvious to someone of ordinary skill in the art, given these references, to combine the database flow creation teachings of *Muller* with the teachings of *Robotham* in order to allow for the processing of packets of new flows as spoken of on column 11, lines 46-52 of *Muller*.

Regarding claim **12**, *Robotham* further teaches the storage of received data units (packets) in buffer 20 (local memory) as spoken of on column 3, lines 36-40.

Regarding claim **13**, *Robotham* further teaches where count table 40 (counter) is coupled to buffer 20 (memory) as shown in Figure 1.

Regarding claim **14**, *Robotham* further teaches that the count values (total count signal) in the count table 40 are adjusted to always reflect the current state (whether packets have been partially processed) of the buffer 20 as spoken of on column 3, lines 62-66.

Regarding claim **18**, *Robotham* teaches the buffering circuit 100 (system) as shown in Figure 1.

Robotham also teaches congestion monitoring block 60 (central processing unit) as shown in Figure 1.

Robotham also teaches buffer 20 (system memory) coupled to congestion monitoring block 60 (central processing unit) as shown in Figure 1.

Robotham also teaches reception block 10 and transmission block 50 (network interfaces) coupled to buffer 20 (system memory) and congestion monitoring block 60 (central processing unit) as shown in Figure 1.

Robotham teaches the storage of received data units (packets) in buffer 20 (memory) coupled to transmission block 50 (circuitry portion) of Figure 1 as spoken of on column 3, lines 36-40.

Robotham also teaches the incrementing of count values of count table 40 (counter) as received data units (packets) are stored in the buffer 20 as spoken of on column 2, lines 45-48.

Robotham also teaches the referencing (checking) of a context table (connection table) upon reception of data units (packets) as spoken of on column 2, lines 43-45.

Robotham also teaches transmission block 50 that determines stream identifiers (packet processing) corresponding to fetched data units (packets) as spoken of on column 3, lines 45-49.

Robotham also teaches transmission block 50 that transmits (forwards) the fetched data units (packets) as transmitted data units as spoken of on column 3, lines 56-58.

Robotham also teaches the dequeuing of data from the buffer (clearing the buffer) for forwarding as spoken of on column 2, lines 49-50.

Robotham also teaches the decrementing of count values of count table 40 (counter) as data units are retrieved from the buffer and transmitted as spoken of on column 3, lines 62-64.

Robotham does not teach that responsive to non-existence of the connection table entry, sending the packets to network interface software for preparing the packets for the network interface circuitry, the network interface software for building the connection table entry.

However, *Muller* teaches a packet processing method where a flow database manager uses retrieved packet information to set up a flow in a flow database if one does not already exist for the particular flow as shown in Figure 1B and spoken of on column 11, lines 46-52.

At the time of the invention, it would have been obvious to someone of ordinary skill in the art, given these references, to combine the database flow creation teachings of *Muller* with the teachings of *Robotham* in order to allow for the processing of packets of new flows as spoken of on column 11, lines 46-52 of *Muller*.

Regarding claim 19, *Robotham* further teaches reception block 10 and transmission block 50 (input/output interfaces) coupled to buffer 20 and congestion monitoring block 60 (central processing unit) as shown in Figure 1.

Regarding claim 20, *Robotham* further teaches transmission block 50 (circuitry portion) as shown in Figure 1.

6. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over *Robotham et al.* (U.S. 6,775,293) (hereinafter “*Robotham*”) in view of *Muller et al.* (U.S. 6,483,804) (hereinafter “*Muller*”) and in further view of *Spinney et al.* (U.S. 6,426,943) (hereinafter “*Spinney*”).

Regarding claim 5, *Robotham* in view of *Muller* teaches the method of claim 4. While *Robotham* in view of *Muller* teaches buffer management of a packet-based system, *Robotham* in view of *Muller* does not explicitly teach the use of User Datagram Protocol formatted packets.

However, *Spinney* teaches a method of packet flow processing using queues where UDP packets are used as spoken of on column 27, lines 3-26.

At the time of the invention, it would have been obvious to someone of ordinary skill in the art, given these references, to combine the UDP packet teachings of *Spinney* with the teachings of *Robotham* in view of *Muller* in order to provide efficient packet processing of UDP packets.

7. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over *Robotham et al.* (U.S. 6,775,293) (hereinafter “*Robotham*”) in view of *Muller et al.* (U.S. 6,483,804) (hereinafter “*Muller*”) and in further view of *Wei* (U.S. 6,560,196).

Regarding claim 6, *Robotham* in view of *Muller* teaches the method of claim 4. While *Robotham* in view of *Muller* teaches buffer management of a packet-based system, *Robotham* in view of *Muller* does not explicitly teach the use of Voice over Internet Protocol formatted packets.

However, *Wei* teaches a method of packet flow processing using credit buffers and counters where VoIP packet transmission is supported as spoken of on column 18, lines 50-61.

At the time of the invention, it would have been obvious to someone of ordinary skill in the art, given these references, to combine the VoIP teachings of *Wei* with the teachings of *Robotham* in view of *Muller* in order to provide efficient packet processing in a VoIP environment.

Conclusion

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Dell et al. (U.S. 7,158,528) as well as Dooley (U.S. 7,203,170) are other references considered pertinent to this application.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Michael J. Moore, Jr. whose telephone number is (571) 272-3168. The examiner can normally be reached on Monday-Friday (7:30am - 4:00pm).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wing F. Chan can be reached at (571) 272-7493. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
